თ. მუსელიანი, მ. ქობალია

ელექტრომოწყობილობათა
ტექნიკური დიაგნოსტიკა

ელექტრომოწყობილობათა ელემენტებისა და
აღრიცხვის კვანძების დიაგნოსტიკა

(I ნაწილი)

დამტკიცებულია სტუ-ს
სარედაქციო-საგამომცემლო
საბჭოს მიერ

თბილისი
2009

სახელმძღვანელოს პირველ ნაწილში წარმოდგენილია ელექტრული წრედების ძირითადი ცნებები და განმარტებები; დიაგნოსტიკის ძირითადი პრინციპები, მეთოდები და საჭირო ტექნიკური საშუალებები; ელექტრული და ელექტრონული წრედებისა და მათი ელემენტების, ელექტრული აპარატების, აღრიცხვის კვანძების მონტაჟისა და დიაგნოსტიკის საკითხები. მინიმუმამდეა დაყვანილი თეორიული მსჯელობები და ძირითადი ყურადღება გადატანილია ელექტროტექნიკისა და ელექტრომოწყობილობათა დიაგნოსტიკის პრობლემების გადაწყვეტის ჩვევების გამომუშავებაზე.

ნაშრომი წარმოადგენს პრაქტიკულ სახელმძღვანელოს და განკუთვნილია, როგორც ძირითადი სახელმძღვანელო, “ელექტრომოწყობილობათა დიაგნოსტიკის” სპეციალობის უმაღლესი პროფესიული განათლებისა და ბაკალავრიატის სტუდენტებისა და მაგისტრანტებისათვის. იგი დიდ დახმარებას გაუწევს აგრეთვე ელექტროსადგურების, ელექტროქსელებისა და სამრეწველო დაწესებულებების ინჟინერ-ტექნიკურ პერსონალს ელექტროდანადგარების ექსპლუატაციის, რემონტისა და დიაგნოსტიკის საკითხების გადაწყვეტის დროს.

რეცენზენტი პროფ. დ. ლაომვილი

სახელმძღვანელო გამოცემა შპს „აკაკასუს ელექტრომარკეტის“ ფინანსური მხარდაჭერით.

მივყავართ გამოსავლელზე ნულივან ზაბვამდე. თუ ნაწილობრივ დამოკლდები, პირველია გრაგნილი, მაშინ იზრდება ტრანსფორმაციის კოეფიციენტი. ამ დროს იზრდება ზაბვა მეორეულ გრაგნილზე და შესაბამისად სემის გამოსავლელზეც. ნაწილობრივ დამოკლდები მეორეული გრაგნილი ამცირებს ტრანსფორმაციის კოეფიციენტს და ზაბვა გამართვლზე მცირდება და შესაბამისად მცირდება გამოსავლელი ზაბვა.

მცველის გადავსა. როგორც ადრე ვხედავდით, მცველის გადავსა ხდება დიოდის გარღვევის შემთხვევაში. ამიტომ სანამ მცველს შევცვლიდით საუროს ვინაშნაც შევამოთ დიოდები. ტრანსფორმაციის პირველია და მეორეული გრაგნილების ნაწილობრივი მოკლედ შეტვას მივყავართ დენის გაზრდასთან, რაც აგრეთვე შეიძლება იყოს მცველის გადავსის მიზეზი. ამიტომ მცველს შევცვლით და შევამოთ ტრანსფორმაცი.

2.7. ძაიანების ნისანი და მიზეზი

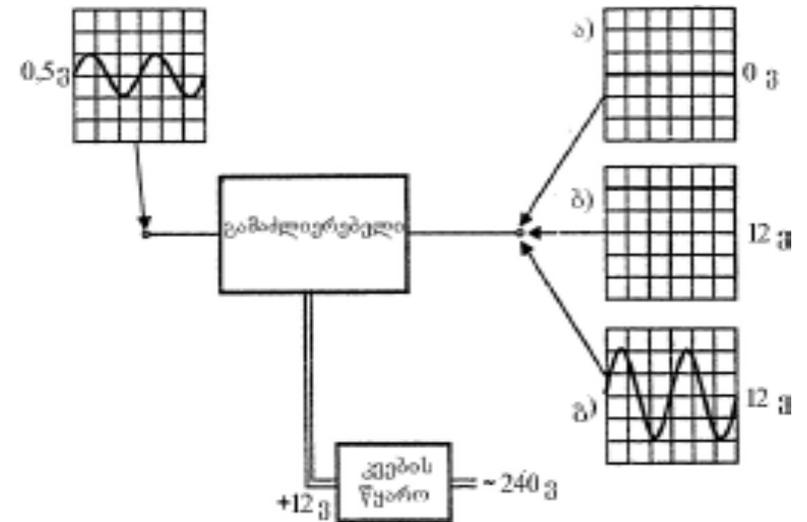

ელექტრული სემის დიაგნოსტიკა სრულდება სამ ეტაპად. პირველი ეტაპზე განისაზრვება სემის ძაიანება. მეორე ეტაპზე ხდება ძაიანების ანალიზი და ამ ძაიანების შესაძლო მიზეზების განსაზრვა. მესამე ეტაპზე ხდება ძაიანების არმოქმევა.

პირველი რიგის საუროს განისაზრვოს ძაიანება. ამისათვის საუროს გავარცოთ მისი ნისები. ძაიანებად ითვლება ისეტი სემა, რომლის გამოსავლელი პარამეტრები არაკორექტულია, მიუხედავად იმისა, რომ შესაძლო პარამეტრები შესრულია.

მაგალითად, ნახ. 2.15-ზე გამოსახული გრაგნილები შესაძლო სიგნალი კორექტულია, მაგრამ გრაგნილები

ბის გამოსავლელზე სიგნალი არ გვაქვს. ამ შემთხვევაში ძაიანების ნისანი ითვლება გრაგნილები ის გამოსავლელზე ზაბვის არ არსებობა.

ეს კონკრეტული ნისანი იქნება საკმარისი ინფორმაციის ძაიანების შესაძლო მიზეზებზე. ძაიანება ერთსა და იგივე ნისანთან (გამოსავლელზე ნულივანი ზაბვა) შეიძლება მიგვიყვანოს სემის სხვადასხვა კომპონენტების ძაიანებამ. სხვა შემთხვევაში ნისანი შეიძლება პირდაპირ მიგვითქვას განსაზრვულ არეზე, სადაც ძაიანების გამოვლენის ალბათობა უფრო მეტია. მაგალითად, გამოსავლელზე მუდმივი ზაბვა, რომელიც თლია კვების ზაბვისა გვიწვინებს, რომ ტრანზისტორი იმყოფება ვაკუუმის რეჟიმში (ნახ. 2.15, ბ). შევამოვს ვიწყებთ გამოსავლელთან მდებარე უახლოესი კასადით და ვმოზრაობთ უკუმართულებით. უნდა შევამოთ ყველა ტრანზისტორი გა-

Nax. 4.14. ორმაგი მოყმედა კონტაქტები:
 a) CarTვა; b) gamorTვა

ბა. ამისათვის გამოიყენება რკალი მკობი მესერი (ნახ. 4.15), რომელიც შედგება special ურის ფორმის, ერთმანეთისაგან იზოლირებული ფოლადის ჩიჩქისაგან. როცა კონტაქტები გაითიშება, მაშინ ვარმოიქმნება ელექტრული რკალი, ჩიჩქისათვის არიზრება მანტური ველი, რომელიც რკალს ვაანაცვლებს მესერისაკენ. ელექტრული რკალი გრძელდება ისე ება მრავალ მცირე რკალად, რომელთა ტემპერატურა ეცემა მესერის ჩიჩქის მარალი ტბოგამტარობის გამო და არა იწვევს ჰერის იონიზაციას.

დდაცვის ელემენტები. ამ ელემენტების ფუნქციაა გადართვის ან მოკლედ სერტვის შემთხვევაში გათისოს მუშა მექანიზმი.

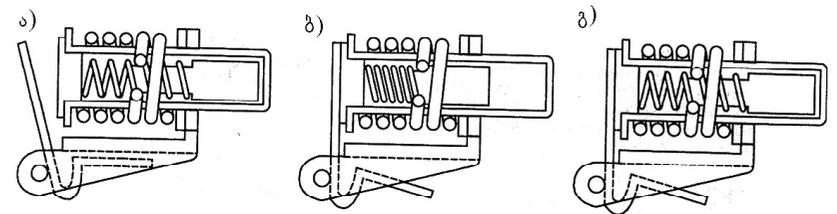

Nax. 4.15. რკალი მკობი

გადართვის შემთხვევაში არსებობს გათისვის ორ მეთოდი: ბიმეტალიური და ჰიდრული. ბიმეტალიური მეთოდის გამოყენების დროს ვრდებიან თისვის ორ სხვადასხვა გვარის მალისაგან შედგენილი ბიმეტალიური ელემენტი. დიდი დენების გავლის დროს ბიმეტალიური ელემენტი მოიწონება იმდენად, რომ იმოყმედას გათისვის ჩიჩქისაგან. ეს ელემენტი აივობა მხოლოდ საჭირო პირობებში და არ შეიძლება დავარდნილი მათი მთლიანობა.

ჰიდრული მეთოდი დაფუძნებულია სოლენოიდის გამოყენების დენის მიერ გამოწვეულ ძალაზე. ნორმალურ პირობებში ელექტრომანტის ძალა (ნახ. 4.16) ვაწონავს ვრდულია ვამბარის ვნების ძალა. გადართვის დროს ელექტრომანტის ძალა იზრდება, რის გამოც იზრდება ვაწონა ვამბარაზე და მოზრავი რკლის გული გათისვის მუშა მექანიზმი.

მოკლედ სერტვის შემთხვევაში საშიშროა უფრო სწრაფ-მოყმედი დაცვის მოწყობილობა. ამ მიზეზით ტერმული ელემენტთან ერთად გამოიყენება მანტური გათისვის პრინციპი.

მოკლედ სერტვის შემთხვევაში მოკლედ სერტვის დენი აიზრებს ელექტრომანტის მიზიდვის ძალა, რომელიც

nax. 4.16. ჰიდრული გათისვის მეთოდი:
 a) normal ურის მოყმედა; b) სენილებული მოყმედა; g) მისერი მოყმედა

ნახ. 5.7. აკტიური მრიცხველი და ვექტორული დიაგრამა

მაგრამ პრაქტიკაში დენები სამივე ფაზაში უმეტესად განსხვავებულია, ამიტომ P_{Σ} -ის გამოსახულებაში უნდა შევითვინოთ სამივე ფაზის დენების საშუალო სიდიდე და P_{Σ} მიიღება შემდეგ სახეს:

$$P_{\Sigma} = \sqrt{3} \cdot V_s \frac{I_A + I_B + I_C}{3} \cos \varphi. \quad (5.6)$$

გამართლების შედეგად მიიღება

$$P_{\Sigma} = V_f (I_A + I_B + I_C) \cos \varphi. \quad (5.7)$$

მრიცხველი ის შემოწმებას ვაწარმოებთ იგივე მეთოდით, როგორც ერთფაზა მრიცხველი ის დროს რომელიც არ ვერ იქნება 5.3-ში. იმ განსხვავებით, რომ მრიცხველი ის შემოწმებას ვაწარმოებთ უნდა დავიცვათ სამფაზა დენი ფაზების შორი ტანმიმდევრობა. შემოწმებას ვაწარმოებთ ფაზაშეცვლილი ტ. ფაზების პირდაპირი ტანმიმდევრობის დროს არნისნული ხელსაწყო დისკო ბრუნავს საათის ისრის მიმართულებით, ხოლო უკუტანმიმდევრობის დროს

- საწინააღმდეგო მიმართულებით. უკუტანმიმდევრობის შემთხვევაში მრიცხველი ის რომელიმე ფაზაში უნდა შევცვალოთ ადგილებს. პირველი რიგში მრიცხველი სვამოწმებთ ტვიტსვლი აზე. შემდეგ სიმზლი ავრის საზომი რაიმე ხელსაწყო არსებობს შემთხვევაში გავზომოთ კვლეის ტიტოელი ფაზაში გამავალი სიმზლი ავრები ცალ-ცალკე და მივხვდებით სედეგები სევაჯამოტ. ამური სიმზლი ავრები თლი იქნება:

$$P_{\Sigma} = P_A + P_B + P_C \text{ კვტ.}$$

თუ სიმზლი ავრის საზომი ხელსაწყო არ გავაჩნია, მაშინ ვამზომთა და დენის მარვუხით ცავართოტ გავომები იგივე მეთოდით, როგორც ერთფაზა მრიცხველი ის შემთხვევაში და (5.6) ან (5.7) ფორმულებით განვსაზრვოტ კვლეის აკტიური სიმზლი ავრები.

მივხვდებით სიდიდე სევადართოტ (5.3) ფორმულიტ მივხვდებით P_{mr} სიდიდეს. თუ

$$P_{\Sigma} \approx P_{mr}.$$

მაშინ მრიცხველი ის სწორად მუშაობს.

პირდაპირი კართვის აკტიური ენერჯის მრიცხველი ებისაშუალებას იქნება გავომიენოტ ისეთ კვლეისი, სადაც დავირტვა არაშემატება 120 ამპერს. უფრო მზლი ავრები კვლეისი სიმზლი ავრის არსარიცხავად გამოიყენება ირიბი-სეერთების მრიცხველი ები, რომლებიც კვლეის ტანმირტებულისი არიან დენის ტრანსფორტორის საშუალებით.

5.5. გავომის ზრვარის გაფართობა

ზემოტ განხილული მრიცხველი ები კვლეისი უშუალოდ არის კართული, ამიტომ ასეთ მრიცხველებს პირდაპირი კართვის მრიცხველებს უწოდებენ. პირდაპირი კართვის
